

Heating System Conversion from Natural Gas to Propane

A Service provided by AICHELIN Group

CONVERSION AND MODERNIZATION

Process Safety + Optimization of Downtimes

SAFETY AND FLEXIBILITY EVEN IN DIFFICULT TIMES

The volatile natural gas supply situation is an issue that impacts everyone, including, of course, the heat treatment industry. Only if you properly prepare for alternatives, will you be able to maintain delivery availability for your customers even if the situation deteriorates. The operation of your plants with natural gas comes with extensive economic risks, which makes switching to alternative sources of energy all the more sensible for many companies.

THE AICHELIN SOLUTION: FLEXIBILITY FOR THE FUTURE

Converting your heating system from natural gas to propane is a relatively simple measure to ensure continuous operation of your plants in case of a natural gas supply bottleneck. We will check the existing burner technology for you and define the required measures individually.

This usually includes adjusting the gas pressure control line plus governor and flow display as well as the connection point for propane supply. The gas burners will be adjusted to the new medium and then optimally adapted to the new setup.

After this adjustment, you will always be able to switch back or switch between the two different supply sources with very little effort. We will happily make the **necessary adjustment of the gas burner** to the respective source of energy for you.

YOUR ADVANTAGES

- Short conversion time
- Predictable regarding time and cost
- Fair pricing and simple processing, as is standard for us
- One-stop service
- Parts in AICHELIN quality
- Flexibility for the future

YOUR RELIABLE PARTNER

- High flexibility when it comes to your desires and needs
- Play it safe, with your renowned heat treatment partner.
- Long-term experience in all things heat treatment from a strong group of companies
